Manual for pgf-spectra 1.0

Hugo Gomes
hugo.parelho@gmail.com

21st April 2016

Abstract

The purpose of this package is to draw the spectrum of elements in a simple way. It's based on the package *pst-spectra* with similar options, but with some extra options. It relays on the pgf/TikZ to draw the desired spectrum, continuous or discrete. As in *pst-spectra* there are data available for the spectra of 99 elements and their ions (from the NASA database). It also allows the user to draw a spectrum with their own personal data.

Contents

Installation and usage

pgf-spectra is placed under the terms of the LaTeX Project Public License, version 1.3 or later (http://www.latex-project.org/lppl.txt). pgf-spectra loads and requires the packages *tikz* and *ifthen*.
You need to put the style file (pgf-spectra.sty) in a location where pdflatex can find them. According to the TDS conventions this may be a subdirectory named tex/latex/pgfspectra/ or tex/latex/misc/ in your (site specific) installation tree (insert your appropriate directory delimiter instead of /, if needed).
If you are using pdflatex, just can simply include the style file without any option via the \usepackage command: \usepackage{pgf-spectra}

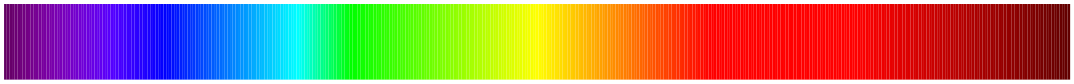
The commands

There are at this time only two commands available:

- \pgfspectra or \pgfspectra[options list]
- and \wlcolor{\wavelength}

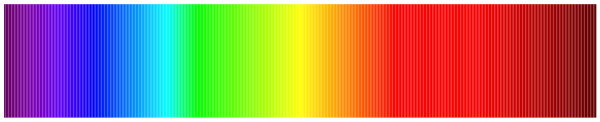
The first command is used without options to draw the visible continuous spectrum:

```
\pgfspectra
```



When using options a continuous or discrete spectra in the visible region can be drawn, for instance:

```
\pgfspectra[width=.5\textwidth,height=1.5cm]
```



```
\pgfspectra[width=\textwidth,element=Ne]
```

The other command is used to convert a wavelength (from 380 to 780 nanometers) to the respective color available as 'wlcolor':

```
\tikz{\foreach \x in {380,430,...,780}{
          \wlcolor{\x}
          \draw[fill=wlcolor] (.02*\x,0) rectangle ++(1,.5)
                  node[midway,font=\tiny\bfseries,text=black!50] {\x};
          }
}
```

Options

For the command \pgfspectra there are a set of options available to draw the spectrum as described below.

width default: *0.9\textwidth*

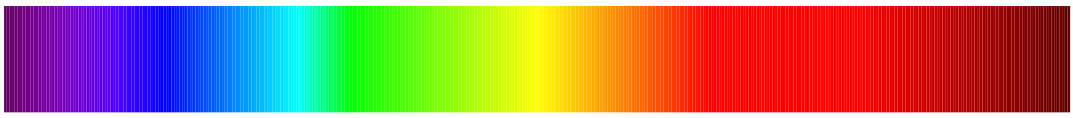
Sets the width of the spectrum.

```
\pgfspectra[width=10cm]
```

height default: *1cm*

Sets the height of the spectrum.

```
\pgfspectra[height=40pt]
```



element default: *NONE*

A single chemical symbol of an element or a list of chemical symbols.

```
\pgfspectra[element=H]
```

```
\pgfspectra[element={H,He}]
```

charge default: *0*

The charge of the *particle* to draw the spectrum. Use 'all' to get all available lines for the element, i.e, for the atom and all the positive ions that exists in the database.

```
\pgfspectra[element=He]
```

```
\pgfspectra[element=He,charge=1]
```

```
\pgfspectra[element=He,charge=2]
```

Element "He" with charge "2" have no lines to display.

```
\pgfspectra[element=He,charge=all]
```

Imin default: *0*

The minimum intensity of the lines to put in the spectrum. Value from 0 to 1.

```
\pgfspectra[element=He,Imin=.5]
```

```
\pgfspectra[element=He,Imin=.05]
```

relative intensity default: *false*

Draws the lines respecting the intensity of the observed spectrum.

```
\pgfspectra[element=He,relative intensity]
```

relative intensity threshold default: *0.25*

Sets the minimum intensity for the lines in the spectrum when using relative intensities. When set to 0.25 a line with real intensity 0 will have a spectral intensity of 0.25 and a line with intensity equal to the max intensity observed in that spectrum will have an intensity in the computed spectrum of 1, assuming of course an overall intensity in the range between 0 and 1.

```
\pgfspectra[element=He,relative intensity,relative intensity threshold=0]
```

```
\pgfspectra[element=He,relative intensity,relative intensity threshold=.25]
```

```
\pgfspectra[element=He,relative intensity,relative intensity threshold=.5]
```

```
\pgfspectra[element=He,relative intensity,relative intensity threshold=.75]
```

```
\pgfspectra[element=He,relative intensity,relative intensity threshold=1]
```

In fact setting the relative intensity threshold to 1 is equivalent to the spectrum without relative intensities:

```
\pgfspectra[element=He]
```

line intensity default: *100*

Draws all the lines with the specified intensity between 0 and 100 (as a percentage of the maximum intensity).

```
\pgfspectra[element=He,line intensity=0]
```

```
\pgfspectra[element=He,line intensity=50]
```

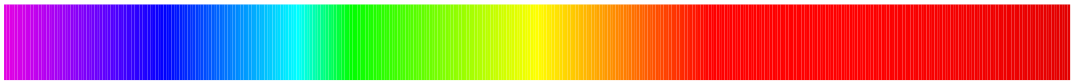
```
\pgfspectra[element=He,line intensity=100]
```

```
\pgfspectra[element=He]
```

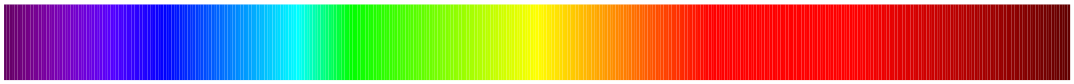
gamma default: *0.8*

Gamma color correction: any positive value.

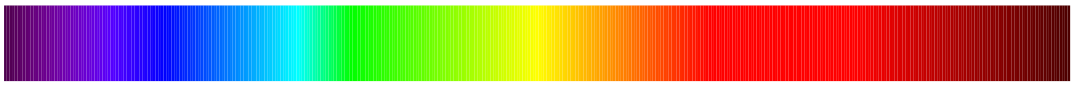
```
\pgfspectra[gamma=.1]
```



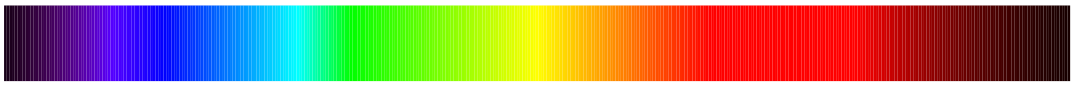
```
\pgfspectra[gamma=.8]
```



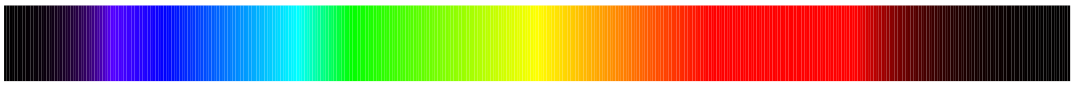
```
\pgfspectra[gamma=1]
```



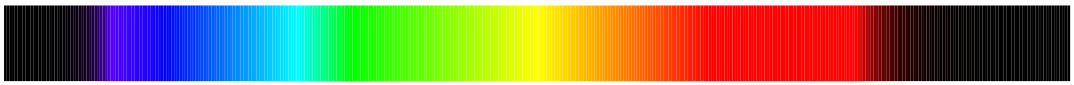
```
\pgfspectra[gamma=2]
```



```
\pgfspectra[gamma=5]
```



```
\pgfspectra[gamma=10]
```

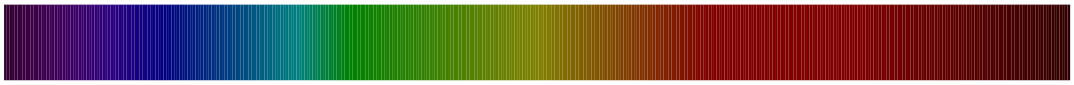


brightness default: *1*

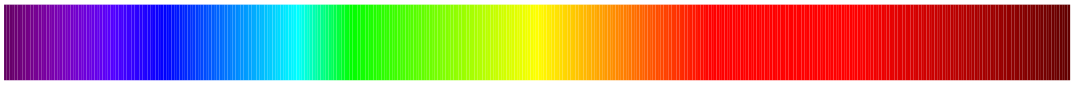
Brightness color correction as in the CMYK color model. Value between 0 and 1. Zero stands for black and one for the maximum bright. *This option only works for the continuous component of the spectra, to change the "brightness" of spectral lines use the option 'line intensity'.*

```
\pgfspectra[brightness=.1]
```

```
\pgfspectra[brightness=.5]
```



```
\pgfspectra[brightness=1]
```



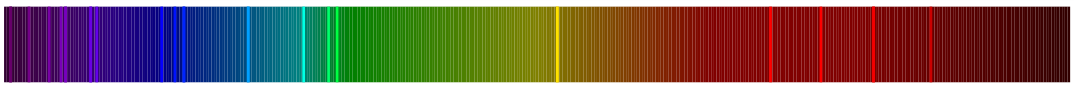
back default: *black*

Sets the background color of the spectrum. Only useful when there are spectral lines. Some shorthand are defined to put the visible region in the background: 'visible5', 'visible10', 'visible15', . . . , 'visible100'. This labels combined with the 'brightness' option makes it possible to achieve other values on the background, since the visible amount (5%,10%,. . .) is multiplied by the value of brightness.

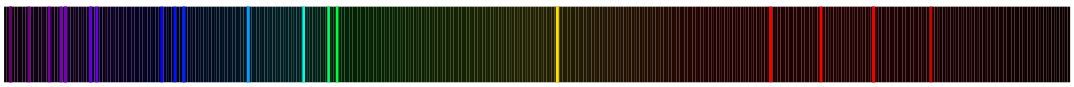
```
\pgfspectra[element=He,back=white]
```

```
\pgfspectra[element=He,back=black!50]
```

```
\pgfspectra[element=He,back=visible50]
```



```
\pgfspectra[element=He,back=visible50,brightness=.26]
```



lines default: *{}*

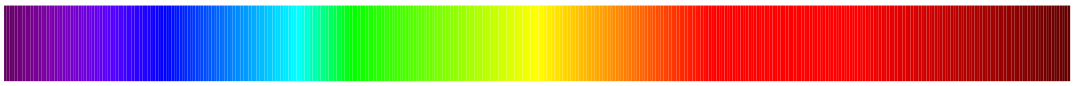
A comma separated list of wavelengths in the interval $[380; 780]\,nm$.

```
\pgfspectra[lines={400,500,550,700}]
```

line width default: *1pt*

The width of each individual line in the spectrum.

```
\pgfspectra[line width=2pt]
```

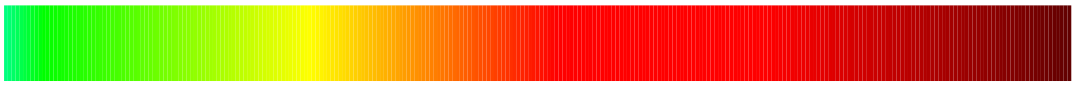


```
\pgfspectra[line width=2pt,element=He]
```

begin default: *380*

The starting wavelength in nanometers of the spectrum ($380 \leq \lambda \leq 780$).

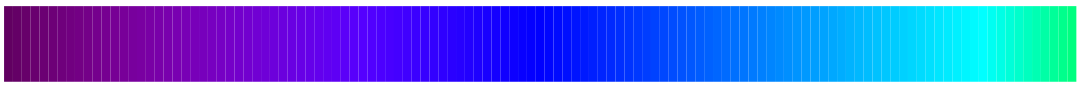
```
\pgfspectra[begin=500]
```



end default: *780*

The finishing wavelength in nanometers of the spectrum ($380 \leq \lambda \leq 780$).

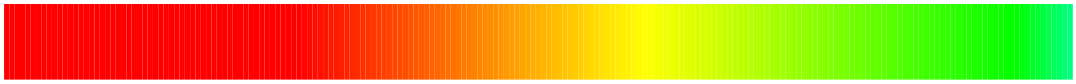
```
\pgfspectra[end=500]
```



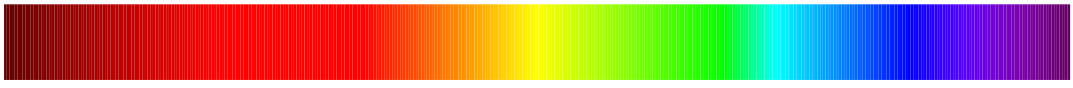
Remark: *it's obviously possible to set 'begin' and 'end' at the same time and if desired change the order of the wavelengths.*

```
\pgfspectra[begin=500,end=700]
```

```
\pgfspectra[begin=700,end=500]
```



```
\pgfspectra[begin=780,end=380]
```

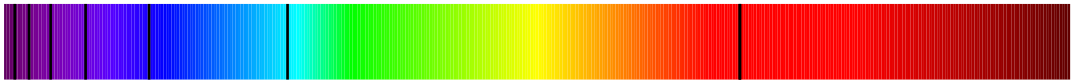


```
\pgfspectra[begin=780,end=380,element=He]
```

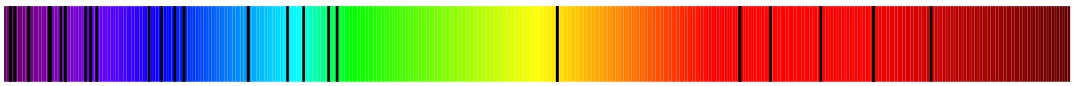
absorption default: *false*

Draws the absorption spectrum instead of the emission one.

```
\pgfspectra[element=H,absorption]
```



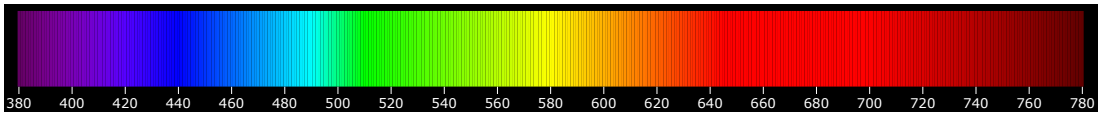
```
\pgfspectra[element={H,He},absorption]
```



axis default: *false*

Draws a nanometric axis below the spectrum.

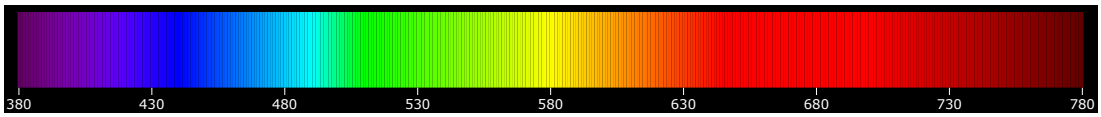
```
\pgfspectra[axis]
```



axis step default: *20*

The increment to use in the axis scale.

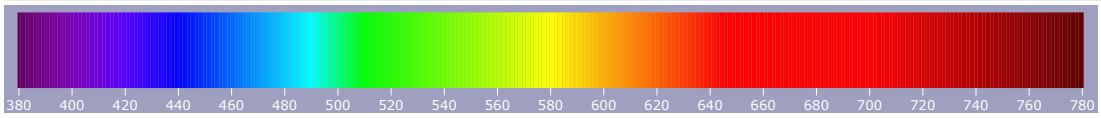
```
\pgfspectra[axis,axis step=50]
```



axis color default: *black*

The color of the axis.

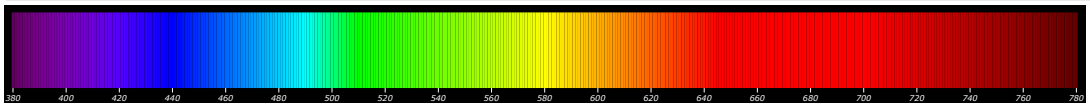
```
\pgfspectra[axis,axis color=red!50!green!50!blue!50]
```



axis font default: *\tiny*

The font specs to use in the axis.

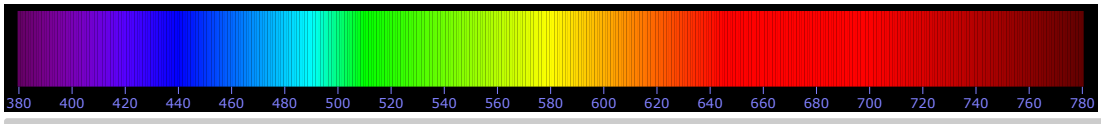
```
\pgfspectra[axis,axis font=\fontsize{3}{3}\itshape\selectfont]
```



axis font color default: *white*

The color of the font used in the axis.

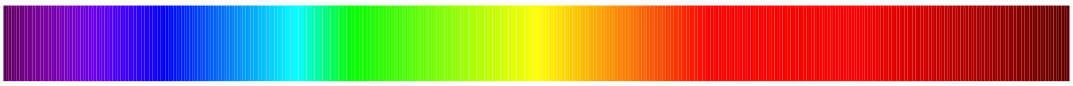
```
\pgfspectra[axis,axis font color=blue!50!white]
```



label default: *false*

Puts a label for the spectrum.

```
\pgfspectra[label]
```



```
\pgfspectra[label,element=He]
```

label position default: *west*

Sets the position of the label according to:

north west | north | north east
west | *spectrum* | east
south west | south | south east

```
\pgfspectra[label,label position=east,element=He]
```

label font default: *\bfseries\small*

The font specs for the label.

```
\pgfspectra[label,label font=\footnotesize\itshape,element=He]
```

label font color default: *black*

The color of the font used in the label.

```
\pgfspectra[label,label font color=blue!50!white,element=He]
```

label before text default: *{}*

Inserts text before the value stored in the label: if chemical symbols were provided, the label has them stored, otherwise it is empty.

```
\pgfspectra[label,label before text=text\ ,element=He]
```

Remark: *The \␣ is to insert a space between the text entered by user and the text stored in label.*

label after text default: *{}*

Inserts text after the value stored in the label: if chemical symbols were provided, the label has them stored, otherwise it is empty.

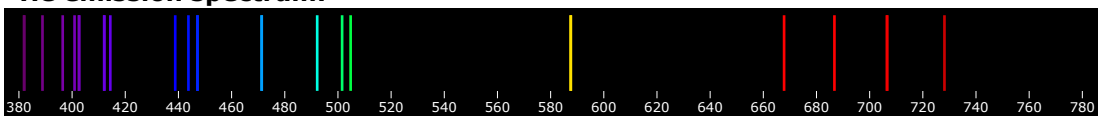
```
\pgfspectra[label,label after text=\ text,element=He]
```

Examples

Here are some examples for drawing some *eventually useful* spectra:

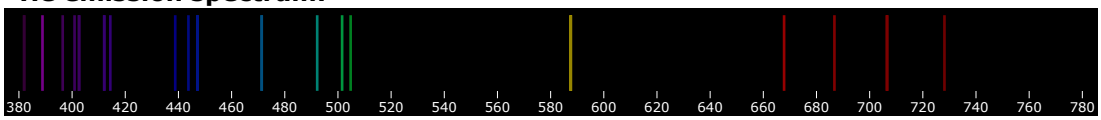
```
\pgfspectra[element=He,axis,label,label position=north west,
label after text=\ emission spectrum:]
```

He emission spectrum:



```
\pgfspectra[element=He,axis,label,label position=north west,label after text=
\ emission spectrum:,relative intensity,relative intensity threshold=.5]
```

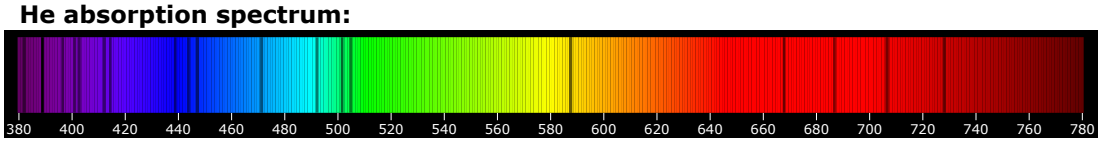
He emission spectrum:



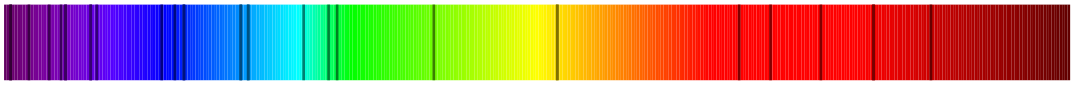
```
\pgfspectra[element=He,charge=all,line intensity=50,Imin=.05]
```

```
\pgfspectra[element=He,absorption,axis,label,label position=north west,label after
text=\ absorption spectrum:,relative intensity,relative intensity threshold=.5]
```

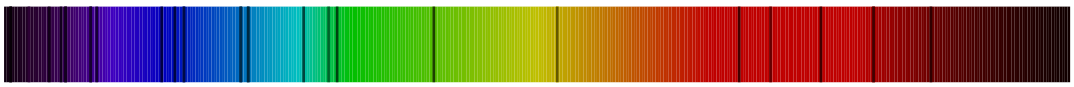
He absorption spectrum:



```
\pgfspectra[element=He,charge=all,absorption,line intensity=50]
```



```
\pgfspectra[element=He,charge=all,relative intensity,back=visible75,gamma=2]
```

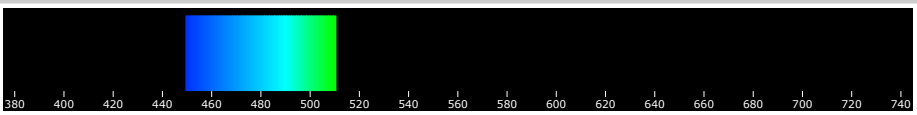


When the lines are manually inserted it's possible to use 'label before text' only with personalized text. In the next three examples 'label before text' is used to make labels for a multiple choice problem, omitting evidently the type of luminous font.

✓ Blue LED

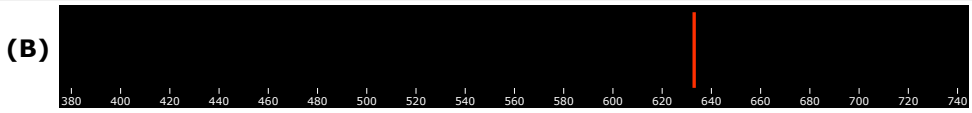
```
\pgfspectra[begin=380,end=740,lines={450,451,452,453,454,455,456,457,458,459,
460,461,462,463,464,465,466,467,468,469,470,471,472,473,474,475,476,477,478,
479,480,481,482,483,484,485,486,487,488,489,490,491,492,493,494,495,496,497,
498,499,500,501,502,503,504,505,506,507,508,509,510},line width=1.25pt,width=
.75\linewidth,label,axis,label before text=(A),axis font=\fontsize{4pt}{6pt}\selectfont]
```

(A)



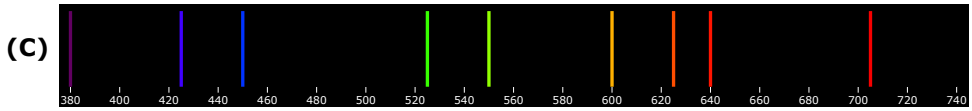
✓ Laser He-Ne

```
\pgfspectra[begin=380,end=740,lines={633},line
width=1.25pt,width=.75\linewidth,label,axis,label before text=(B),axis
font=\fontsize{4pt}{6pt}\selectfont]
```



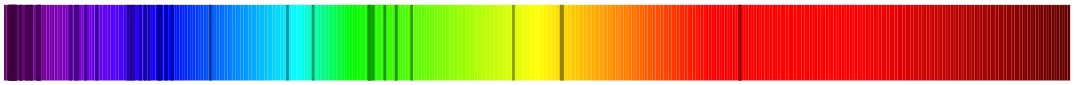
✓ Fluorescent lamp

```
\pgfspectra[begin=380,end=740,lines={380,425,450,525,550,600,625,640,705},line
width=1.25pt,width=.75\linewidth,label,axis,label before text=(C),axis
font=\fontsize{4pt}{6pt}\selectfont]
```



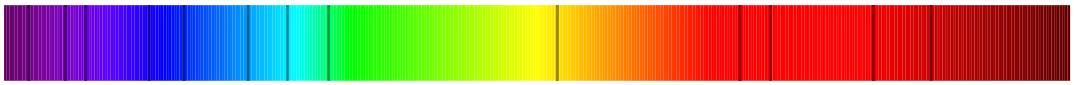
✓ Sun like spectrum

```
\pgfspectra[element={H,Fe,Mg,Na},absorption,line intensity=40,Imin=.05]
```



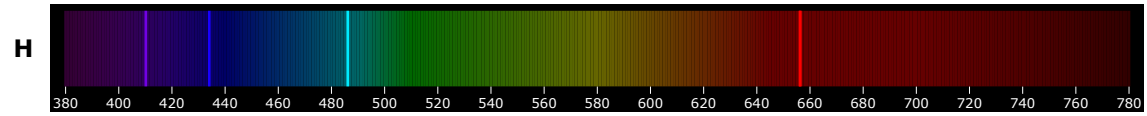
✓ Sirius like spectrum

```
\pgfspectra[element={H,He},absorption,line intensity=40,Imin=.05]
```

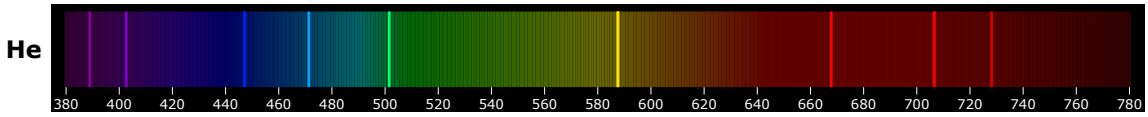


✓ “Classical” emission spectra of elements:

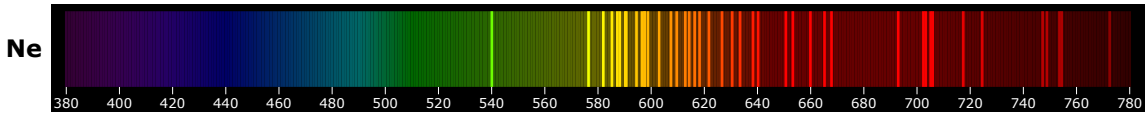
```
\pgfspectra[element=H,back=visible40,gamma=.6,label,axis,Imin=.05]
```



```
\pgfspectra[element=He,back=visible40,gamma=.6,label,axis,Imin=.05]
```



```
\pgfspectra[element=Ne,back=visible40,gamma=.6,label,axis,Imin=.05]
```



Recommendations and known issues

The code could be a bit slow, so if there are many spectra to draw, the time consumption to get them could be high. In that case it's preferable to compile individual spectrum via the *preview* package, for later inclusion with `\includegraphics{<filename>.pdf}`:

```
% <filename>.tex
\documentclass{article}
\usepackage{pgf-spectra}
\usepackage[active,tightpage]{preview}
\PreviewEnvironment{tikzpicture}
\setlength\PreviewBorder{1pt}%
%%%%%%%%%%%%%%%%%%
\begin{document}
\pgfspectra[element=H,width=15cm]
\end{document}
```

The code

```

% nm2rgb convert nanometer wavelength to rgb
% (380 <= Lambda <= 780 ) -> r,g,b on stack
%
% BASED on FORTRAN Code
% RGB VALUES FOR VISIBLE WAVELENGTHS by Dan Bruton (astro@tamu.edu)
% This program can be found at
% http://www.physics.sfasu.edu/astro/color.html
% and was last updated on February 20, 1996.
% The spectrum is generated using approximate RGB values for visible
% wavelengths between 380 nm and 780 nm.
% The red, green and blue values (RGB) are
% assumed to vary linearly with wavelength (for GAMMA=1).
